Performance analysis of distributed applications using automatic classification of communication inefficiencies

82%

Jeffrey Vetter

Proceedings of the 14th international conference on Supercomputing May 2000 We present a technique for performance analysis that helps users understand the communication behavior of their message passing applications. Our method automatically classifies individual communication operations and it reveals the cause of communication inefficiencies in the application. This classification allows the developer to focus quickly on the culprits of truly inefficient behavior, rather than manually foraging through massive amounts of performance data. Specifically, we trace t ...

2 Experience with application of modern software management controls

77%

Donald L. Paster

Proceedings of the 5th international conference on Software engineering March 1981 This paper presents the experience of the Software Development Laboratory of Raytheon Company, Submarine Signal Division, in applying modern software management control techniques to the development of software for real-time embedded computer systems. The paper initially describes the characteristics of the software projects during the period 1969-1979, and the ultimate use of the systems. The software is developed for embedded computers of many types and for systems requiring from one to e ...

3 Database and digital library technologies: Decision tree classification of spatial data streams using Peano Count Trees

77%

Qiang Ding, Qin Ding, William Perrizo

Proceedings of the 2002 ACM symposium on Applied computing March 2002 Many organizations have large quantities of spatial data collected in various application areas,

1004

including remote sensing, geographical information systems (GIS), astronomy, computer cartography, environmental assessment and planning, etc. These data collections are growing rapidly and can therefore be considered as spatial data streams. For data stream classification, time is a major issue. However, these spatial data sets are too large to be classified effectively in a reasonable amount of tim ...

The importance of translucence in mobile computing systems

77%

Maria R. Ebling, Bonnie E. John, M. Satyanarayanan

ACM Transactions on Computer-Human Interaction (TOCHI) March 2002

Volume 9 Issue 1

Mobile computing has been an active area of research for the past decade, but its importance will increase substantially in the decade to come. One problem faced by designers of mobile systems is that of maintaining the illusion of connectivity even when network performance is poor or non-existent. The Coda file system uses its cache to maintain this illusion. Extensive experience with the system suggests that, although users find the functionality provided by the system extremely valuable, new ...

Strategic computing at DARPA: overview and assessment

77%

Mark Stefik

Communications of the ACM July 1985

Volume 28 Issue 7

Strategic Computing, a 10-year initiative to build faster and more intelligent systems, is ambitious, flawed by overscheduling perhaps and problems of definition, but basically sound.

Report of the public cryptography study group

Document centered approach to text normalization

77%

Andrei Mikheev

Proceedings of the 23rd annual international ACM SIGIR conference on Research and development in information retrieval July 2000

In this paper we present an approach to tackle three important problems of text normalization: sentence boundary disambiguation, disambiguation of capitalized words when they are used in positions where capitalization is expected, and identification of abbreviations. The main feature of our approach is that it uses a minimum of pre-built resources, instead dynamically inferring disambiguation clues from the entire document itself. This makes it domain independent, closely targeted to each ...

Data clustering: a review

77%

A. K. Jain, M. N. Murty, P. J. Flynn

ACM Computing Surveys (CSUR) September 1999

Volume 31 Issue 3

Clustering is the unsupervised classification of patterns (observations, data items, or feature vectors) into groups (clusters). The clustering problem has been addressed in many contexts

and by researchers in many disciplines; this reflects its broad appeal and usefulness as one of the steps in exploratory data analysis. However, clustering is a difficult problem combinatorially, and differences in assumptions and contexts in different communities has made the transfer of useful generic co ...

Fuzzy RuleNet: an artificial neural network model for fuzzy classification

77%

Nadine Tschichold-Gürman

Proceedings of the 1994 ACM symposium on Applied computing April 1994

10 Context-sensitive learning methods for text categorization

77%

William W. Cohen, Yoram Singer

ACM Transactions on Information Systems (TOIS) April 1999

Volume 17 Issue 2

Two recently implemented machine-learning algorithms, RIPPER and sleeping-experts for phrases, are evaluated on a number of large text categorization problems. These algorithms both construct classifiers that allow the " context" of a word w to affect how (or even whether) the presence or absence of w will contribute to a classification. However, RIPPER and sleeping-experts differ radically in many other respects: ...

11 MetaCost: a general method for making classifiers cost-sensitive

77%

Proceedings of the fifth ACM SIGKDD international conference on Knowledge discovery and data mining August 1999

12 Database design with common sense business reasoning and learning

77%

Veda C. Storey, Roger H. L. Chiang, Debabrata Dey, Robert C. Goldstein, Shankar Sudaresan

ACM Transactions on Database Systems (TODS) December 1997

Volume 22 Issue 4

Automated database design systems embody knowledge about the database design process. However, their lack of knowledge about the domains for which databases are being developed significantly limits their usefulness. A methodology for acquiring and using general world knowledge about business for database design has been developed and implemented in a system called the Common Sense Business Reasoner, which acquires facts about application domains and organizes them into a a hierarchical, con ...

13 Context-sensitive learning methods for text categorization
